Below is my code snippet. WebElement inputOne = driver.findElement(By.id("username")); inputOne.clear(); inputOne.sendKeys("john"); WebElement inputTwo = driver.findElement(By.id("password")); When I put driver.getText() after sending "john" string, I am able to get the input field value. Can anyone please let me know what am I doing wrong here. A: Well getText is a function that is part of JavaScript, but in Java you don't have JavaScript engine in your app. So if your app is running on Android, you will not have JS engine. You can use this example (I wrote this in my code, not tested):
WebElement element = driver.findElement(By.id("username")); String username = element.getText(); Q: How to take a snapshot from Java threads? I am using Javax Timer in my program. Whenever I need to take a snapshot of my program, I want to start a separate thread, which takes the snapshot, from which the main thread can later on access the snapshot. Question : What is the best way to do so? A: The best way is to use a Profiler, like Jprofiler. When running a profiler, it'll show you the methods and threads that are currently running. You just need to pick the thread you want to view. Update: c6a93da74d
