The most significant change in Lightroom is the ability to edit multiple images at the same time. Image stacks are now staple features, as well as useful editing options. There's nothing really new or useful about organizing and collating your images in stacks, but it is nice to see that you can now look at multiple images at the same time, including even working with groupings of multiple images on the same canvas. I also like that you can now modify objects in multiple images at the same time, or even stack multiple layers to create complicated changes. The Basic Panel option includes on-the-fly adjustments that you can make in a fraction of a second. You could say they are presets, but I think they are additive adjustments you can apply to an image without having to store a preset. Lightroom is also a stronger asset manager. When you go to manage your assets, you can now see when files were last updated, view detailed information about any file and even select multiple files at once. You can even zoom in so that you can see specific details even when your files are huge. Then there are smart collections and smart tags that tell you where images are based on where you've been looking or sorting through your images. With Collections, you can easily create a "visual" tour of one or multiple folders of images. You simply create a collection and group images or even multiple albums inside to create a theme for different kinds of images, including product, art, travel, and so on.
